## Basis of Report

This report has been prepared by SLR Consulting Australia Pty Ltd (SLR) with all reasonable skill, care and diligence, and taking account of the timescale and resources allocated to it by agreement with BM Alliance Coal Operations (the Client or BMA). Information reported herein is based on the interpretation of data collected, which has been accepted in good faith as being accurate and valid.

This report is for the exclusive use of the Client. No warranties or guarantees are expressed or should be inferred by any third parties. This report may not be relied upon by other parties without written consent from SLR.

SLR disclaims any responsibility to the Client and others in respect of any matters outside the agreed scope of the work.

## 1.0 Introduction

### 1.1 Background and Overview of the Project

The Blackwater Mine (BWM) is located approximately 20 kilometres (km) south-west of Blackwater in the Bowen Basin, Queensland (**Figure 1-1**). BWM's Mining Leases (MLs) include ML1759, ML1760, ML1761, ML1762, ML1767, ML1771, ML1772, ML1773, ML1792, ML1800, ML1812, ML1829, ML1860, ML1862, ML1907, ML70091, ML70103, ML70104, ML70139, ML70167 and ML70329 (**Figure 1-1**).

The BWM has been in operation since 1967 and operates in accordance with, amongst other authorisations, Environmental Authority (EA) EPML00717813, granted under the *Environmental Protection Act 1994* (Qld) (EP Act), effective from 29 June 2023. The BWM produces up to 16 million tonnes per annum (Mtpa) of product coal.

BM Alliance Coal Operations Pty Ltd (BMA) seek relevant State and Federal approvals to extend the current mining operation through the BWM – North Extension Project (the Project). The Project would extend the mining area of the existing BWM to within Surface Area (SA)10 on ML1759 and SA7 on ML1762 (**Figure 1-1** and **Figure 1-2**) and increase BWM production to up to 17.6 Mtpa (product coal). Importantly, the Project should be viewed in the context that it is an extension and continuation of ongoing mining operations on a portion of the significantly larger BWM mining operation.

The key elements of the Project include, but are not limited to, the following:

- Vegetation clearing, the removal and stockpiling of topsoil material, drilling and blasting of overburden and interburden material.
- Removal of overburden and interburden material (dragline and truck and shovel/excavator methods) to uncover coal, which is placed as back fill in the mined-out pit voids (in-pit spoil dumps) as mining advances.
- Open cut mining (truck and shovel/excavator methods) of Run of Mine (ROM) coal from the coal measures in SA10 on ML1759 and SA7 on ML1762.
- Continued use of BWM infrastructure (e.g., Coal Handling and Preparation Plant (CHPP), Thermal Coal Plant (TCP), ROM and product stockpiles, train load-out, water management system and other supporting infrastructure).
- Continued disposal of rejects and tailings in accordance with the EA.
- Construction and operation of new or relocated infrastructure within SA10 on ML1759 and SA7 on ML1762 to facilitate and/or support the open cut mining extension such as back access roads, access tracks, water management infrastructure and powerlines, laydown areas and build pads.
- A new dragline crossing across Deep Creek.
- Ongoing exploration activities within ML1759 and ML1762.
- Progressive rehabilitation of the mine site.

**FIGURE 1-1**

Surface Area SA7 on ML1762 and SA10 on ML1759 cover a total area of approximately 9,010 hectares (ha). The extent of the proposed Project open cut mining area and out of pit disturbance areas is approximately 3,761 ha (Figure 1-2). If approved, and subject to customer demand, the extension is projected to extend mining at the BWM to within SA7 on ML1762 and SA10 on ML1759 from 2025 to 2085.

## 1.2 Purpose

The purpose of this report is to provide an assessment of impacts to the soil and land resources within the Project. The soil and land resource assessment involved a soil survey and assessment to outline:

- Soil types.
- Soil resources available for rehabilitation (including a soil balance).
- Soil qualities (erosion risk, dispersion, and salinity risks).
- Soil and land resource assessment.
- Management and mitigation measures for handling soil resources during the mine extension and rehabilitation.

## 1.3 Relevant Guidelines and Standards

The following guideline and standards were used for the Land Resource Assessment:

- Department of Natural Resources and Mines (DNRM) and Department of Science, Information Technology, Innovation and the Arts (DSITIA), (2013), Regional Land Suitability Frameworks for Queensland.
- Isbell, R. F., (2021), The Australian Soil Classification Third Edition.
- National Committee on Soil and Terrain (NCST), (2008). Guidelines for Surveying Soil and Land Resources, 2nd edition, Australia.
- NCST, (2009), Australian Soil and Land Survey Field Handbook, 3rd edition. CSIRO Publishing.
- DSITIA & DNRM, (2015). Guidelines for agricultural land evaluation in Queensland (2nd edition).

## 2.0 Methodology

### 2.1 Desktop Review

A desktop assessment was undertaken to establish background information on the baseline soil and land resources within the Project. Various sources have been reviewed during the desktop assessment, including, but not limited to:

- Commonwealth Scientific and Industrial Research Organisation (CSIRO) land systems.
- Australian Soil Resource Information System (ASRIS).
- Terrain-based mapping images including contour information.
- Soil and Landscape Grid of Australia.
- Strategic Cropping Land (SCL) trigger mapping via Queensland Globe.

Geology mapping, vegetation mapping, satellite imagery and aerial photos were also used as inputs prior to undertaking the fieldwork component of the assessment.

### 2.2 Strategic Cropping Land

The *Regional Planning Interests Act 2014* (Qld) (RPI Act) identifies and protects areas of regional interest from inappropriate resource activity or regulated activity. Areas of regional interest identified in the RPI Act include Priority Agricultural Areas (PAA), Priority Living Area (PLA), Strategic Environmental Area (SEA) and Strategic Cropping Area (SCA). SCA consists of SCL as identified in the SCL trigger map. A PAA is an area deemed as highly productive agricultural land by the relevant regional council under a regional plan. The Project does not intercept any areas of regional interest.

### 2.3 Sampling Program and Assessment

#### 2.3.1 Sampling Program

The field soil program was designed as an integrated free survey. An integrated free survey assumes that many land characteristics are interdependent and tend to occur in correlated sets (NCST, 2008). Survey points were irregularly located according to the survey teams' judgement to enable the delineation of soil boundaries. Soil boundaries can be abrupt or gradual, and catena and toposequences are used to aid the description of gradual variation.

Soil survey and mapping was undertaken to exceed a 1:125,000 survey intensity and included collection of the landform pattern and element information, soil profile data, and taxonomic parameters to distinguish soil types and delineations within the Project.

Three types of observations were used for the soil survey:

- Detailed sites, which are observations sites that allow for the identification of any physiographic factors or vegetation associations that characterise the site and associated map unit, along with the major pedological feature of the soil profile. Soil pits were excavated using a backhoe to a maximum depth of 1.2 meters below ground level (mbgl).
- Analysed sites, which are detailed sites from which soil samples are collected and sent to a National Association of Testing Authorities (NATA) accredited laboratory for analysis.
- Check sites, which are mapping observations examined in sufficient detail to allocate the site to a specific soil type and map unit.

43 detailed sites were assessed, with soil samples taken from each site and 37 check sites were assessed to confirm soil type and aid in soil mapping. This methodology produced a survey density of 1 site per 115 ha, which exceeds a 1:125,000 survey scale. The distribution of the field assessment sites is depicted in **Figure 2-1**.

### 2.3.2 Assessment

Soil profiles within the Project were assessed in accordance with the Australian Soil and Land Survey Field Handbook (NCST, 2009) soil classification procedures. Detailed soil profile descriptions were recorded covering the major parameters provided in **Table 2-1**.

**Table 2-1 Field Assessment Parameters**

Detailed Field Assessment Parameters	
Horizon depth including distinctiveness and shape	Pan presence and form
Field texture grade	Permeability and drainage
Field colour (Munsell colour chart)	Field pH
Pedality structure, grade and consistence	Field moisture
Soil fabric and stickiness	Surface condition
Stones (abundance and size)	Landform pattern / element
Mottles (amount, size and distinctiveness)	Current land use and previous disturbance
Segregations (abundance, nature, form and size)	Vegetation

Soil profile logging was undertaken in the field using SLR soil data sheets, including Global Positioning System (GPS) recordings and photographs of the landforms and soil profiles. Soils were classified in accordance with The Australian Soil Classification (Isbell, 2021).

Full laboratory testing was undertaken for 20 of the detailed sites and typical sample depths were 0-10, 20-30, 50-60 and 90-100 centimetres (cm). Laboratory analysis was performed by Environmental Analysis Laboratory at the Southern Cross University Lismore, a laboratory with NATA accreditation for the analyses conducted. The soil testing suite included:

- pH (1:5 water).
- Electrical conductivity (EC).
- Cation exchange capacity (CEC).
- Exchangeable sodium percentage (ESP).
- Particle size analysis (PSA).
- Colour (Munsell).
- Emerson aggregate test (EAT).

Soil salinity in the laboratory analysed samples was determined through the measurement of the EC of 1:5 soil:water suspensions. These values were converted to the EC of a saturated extract (ECe) based on soil texture. Laboratory certificates of analysis are shown in **Appendix A**.

## 3.0 Existing Environment

### 3.1 Climate

The Bureau of Meteorology (BoM) operates the rainfall and evaporation gauges for the nearest meteorological station at Blackwater Water Treatment Plant (BoM Station 035290), located approximately 20 km north of the Project. The annual average rainfall (1995 – 2010) is 542 mm with most rain occurring between December and February. More recent information has been obtained from Blackwater Airport (BoM Station 035134), located approximately 28 km north of the Project for a period between July 2022 and August 2023.

The average monthly rainfall for Blackwater Water Treatment Plant is presented in **Table 3-1**, whilst the average monthly rainfall for Blackwater Airport is presented in **Table 3-2**.

### 3.2 Geology

The Project is situated in the northern region of the Bowen Basin, which is a north-south trending basin divided into broad morphotectonic zones. The Bowen Basin is characterised by gentle easterly dips and minor to moderate deformation on a relatively thin accumulation of sediments. The sediments and stratigraphic sequence were formed by the Permo-Triassic sediments of the Bowen Basin, which are overlain by a range of Tertiary and Quaternary sediments and alluvium. The Project occurs in the southern part of the basin, with the Moranbah and Rangal Coal Measures containing the deposit which is currently extracted by BWM as well as the future deposit for the Project.

### 3.3 Topography and Hydrology

The topographic elevations in and around the Project range from approximately 180 meters Australian Height Datum (mAHD) (northeast of the Project) to 230 mAHD (at the southern end of the extension) as depicted in **Figure 3-1**. Most of the Project is situated on gently undulating lowlands and plains with slopes of 0% to 5%.

The Project lies within the Fitzroy Basin and Mackenzie River sub-basin. Watercourses within the Project are presented in **Figure 3-1**. Watercourses are ephemeral and include Sagittarius Creek and Taurus Creek, with tributaries including Two Mile Gully and Deep Creek. Taurus Creek intersects with Blackwater Creek east of the Project. Downstream of the Project, Blackwater Creek joins with the Mackenzie River. The Nogoia and Comet Rivers merge east of Emerald to form the Mackenzie River, which then joins the Fitzroy River further downstream to discharge into the Coral Sea south-east of Rockhampton, near Port Alma.

**FIGURE 3-1**

### 3.4 Vegetation and Land-Use

Based on a terrestrial ecology study (EMM, 2023), the Project is highly modified from historic vegetation clearing, cattle grazing, weed encroachment and fragmentation whilst being subject to ongoing direct and indirect effects of the operation of BWM. The vegetation within the Project is largely regrowth brigalow and eucalypt woodland communities. The areas of non-remnant vegetation are now largely dominated by introduced Buffel Grass and have been raked of woody debris and rocks and continue to be grazed by livestock.

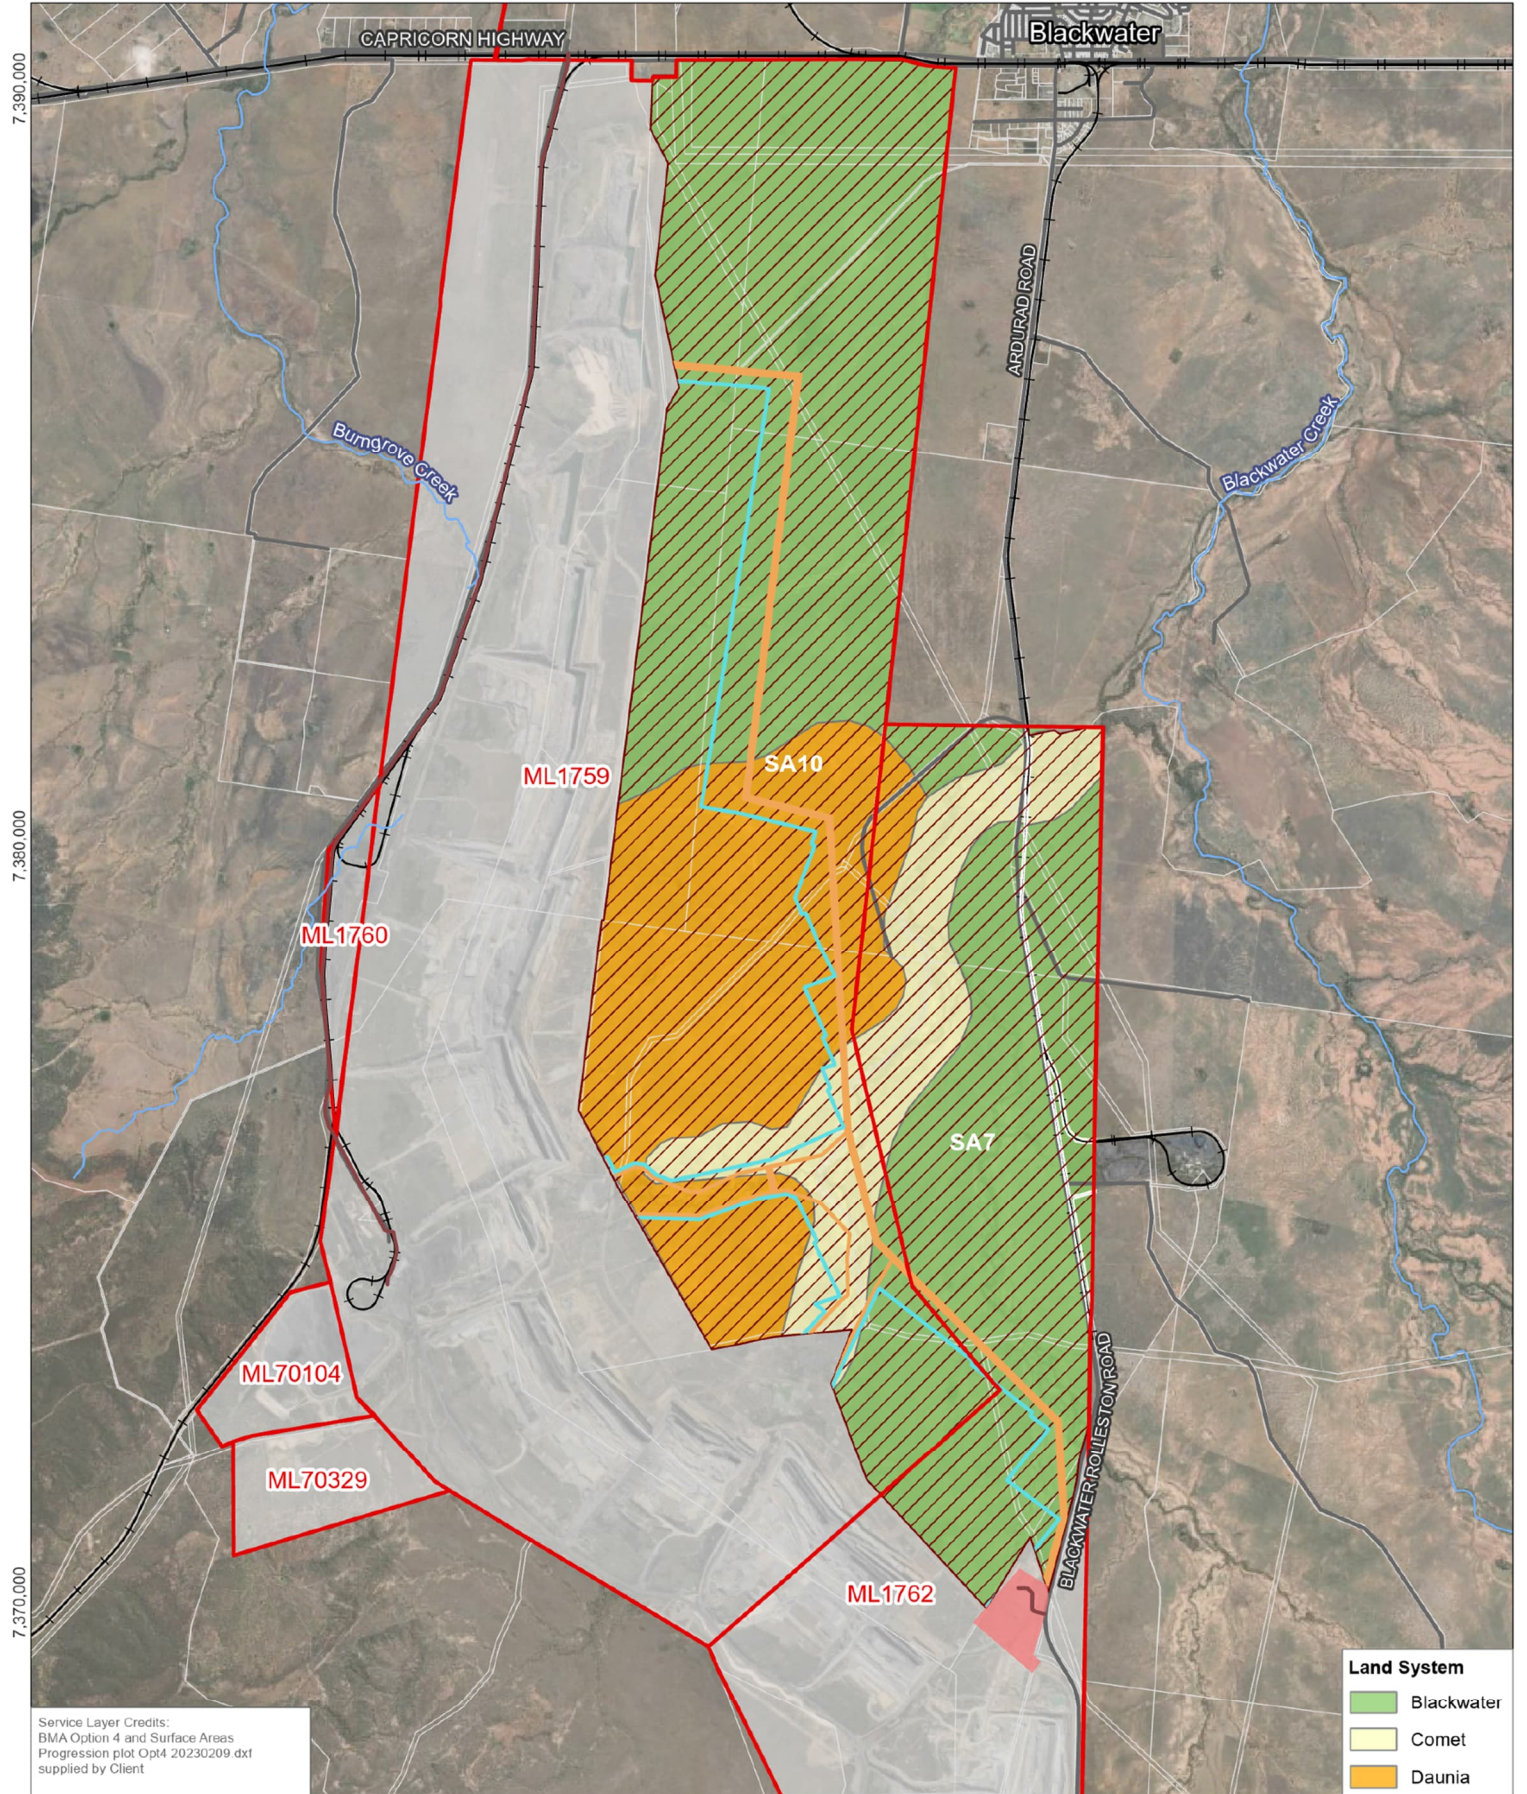

### 3.5 Land Systems

Three land systems occur within the Project; the Daunia, Blackwater and Comet. These are dominated by lowlands with brigalow and cracking clay soils on weathered and fresh Permian shales and lithic sandstone. The Project covered by each Land System and a brief description of attributes is presented in **Table 3-3** and depicted in **Figure 3-2**. The Land System mapping indicates Vertosols would comprise the majority soil type within the Project.

**Table 3-3 Land Systems in the Project**

Land System	Land System Description
Blackwater	Brigalow plains and cracking clay soils on weathered Tertiary clay and older rocks along the central axis of the Project.
Daunia	Lowlands with brigalow and cracking clay soils on weathered and fresh Permian shales and lithic sandstone in the north and centre.
Comet	Alluvial plains with brigalow and cracking clay soils, often flooded, along major streams.

## 4.0 Soil Survey Results

### 4.1 Soil Classification and Description

The soils assessment and subsequent laboratory analysis indicated a total of three (3) dominant and four (4) sub-dominant soil orders within the Project. The dominant soil types within the Project are a Self-Mulching Black-Brown Vertosols, Eutrophic Red Dermosols and Eutrophic Black-Brown Dermosols and are summarised in **Section 4.1.1** and **Section 4.1.2**. Detailed profile descriptions are presented in **Appendix B** and check site descriptions are presented in **Appendix C**.

#### 4.1.1 Vertosols

These are soils with the following:

- A clay field texture of 35% or more clay throughout the solum except for a thin, surface crusty horizons 0.03 m or less thick.
- When dry, open cracks occur at some time in most years. These are at least 5 mm wide and extend upward to the surface or to the base of any plough layer, peaty horizon, self-mulching horizon, or thin, surface crusty horizon.
- Slickensides and/or lenticular peds occur at some depth in the solum.

Self-Mulching Black-Brown Vertosols were identified as the dominant soil type.

The Vertosols within the Project generally consisted of brown to black light to heavy clay A horizons (topsoil) with moderate structure, overlying a medium to heavy medium clay B2 horizon with strong subangular blocky structure. The topsoil showed moderately alkaline, non-sodic and non-saline properties. The B2 horizon generally showed strongly alkaline, sodic to strongly sodic and slightly to moderately saline properties.

#### 4.1.2 Dermosols

These are soils other than Vertosols, Hydrosols, Calcarosols and Ferrosols which:

- Have B2 horizons with a moderate or strong structure throughout the major part of the horizon.
- Do not have clear or abrupt textural B horizons.

The Dermosols were further classified into the following dominant soil types:

- Eutrophic Black-Brown Dermosols.
- Eutrophic Red Dermosols.

The Dermosols within the Project generally consisted of very dark brown to dark reddish-brown clay loam to light clay A horizons (topsoil) with moderate structure, overlying a typically light clay B2 horizon with strong subangular blocky structure. The topsoil showed neutral, non-sodic and non-saline properties, whilst the B2 horizon generally showed strongly alkaline, strongly sodic and moderately saline properties.

## 4.2 Soil Map Units

Within the Project, a total of four (4) Soil Map Units (SMU) were identified based on the dominant Australian Soil Classification (ASC) soil types and the SMUs are presented in **Figure 4-1**. The dominant and sub-dominant soil types per SMU are shown in **Table 4-1** and field investigation sites associated with each SMU are presented in **Table 4-2** and presented in **Figure 4-2**. A summary of the SMUs is included in **Sections 4.2.1 to 4.2.4**.

**Table 4-1 SMU Soil Types and Areas**

Soil Map Unit	Dominant Soil Type	Sub-Dominant Soil Types
1	Self-Mulching Black-Brown Vertosols	Dermosols, Sodosols
2A	Eutrophic Red Dermosols	Nil
2B		
3	Eutrophic Black-Brown Dermosols	Chromosols

The detailed and check sites per SMU are summarised in **Table 4-2** and depicted in **Figure 4-2**, with ASC soil types also presented.

**Table 4-2 Field Investigation Sites**

SMU	ASC Soil Type	Detailed Site	Check Site
1	Self-Mulching Black-Brown Vertosols	B02-B11, B13-B19, B21-B27, B29-B43	C01-C21, C23-C29, C31-C37
2A	Eutrophic Red Dermosols	B28	-
2B	Eutrophic Red Dermosols	B01	C30
3	Eutrophic Black-Brown Dermosols	B12, B20	C22, C35

**FIGURE 4-2**

## **4.2.1 Soil Map Unit 1**

### **4.2.1.1 Description**

The SMU 1 dominant soil types were Black and Brown Self-Mulching Vertosols and sub-dominant soil types included Dermosols and Sodosols.

### **4.2.1.2 Location**

SMU 1 is located across the majority of the site.

### **4.2.1.3 Land-Use**

At the time of the field assessment, the land use within SMU 1 was cattle grazing.

### **4.2.1.4 Management Considerations**

The topsoil within SMU 1 is suitable for stripping and reuse using standard Erosion and Sediment Controls (ESC). The subsoil generally exhibits strong alkalinity, high sodicity and moderate salinity.

If the subsoil is exposed and not managed, in addition to severe agricultural productivity limitations, impacts may include:

- Erosion hazards including tunnel erosion.
- Impeded soil infiltration and permeability.
- Slumping failure of batters.
- Soil dispersion leading to soil structure breakdown, increased run-off and increased turbidity run-off.

## **4.2.2 Soil Map Unit 2A**

### **4.2.2.1 Description**

The SMU 2A dominant soil type was Eutrophic Red Dermosols.

### **4.2.2.2 Location**

SMU 2A is located in the eastern portion of the Project.

### **4.2.2.3 Land-Use**

At the time of the field assessment, the land use within SMU 2A was cattle grazing.

### **4.2.2.4 Management Considerations**

The topsoil within SMU 2A is suitable for stripping and reuse using standard ESC. The subsoil generally exhibits very strong alkalinity, high sodicity and moderate salinity.

If the subsoil is exposed and not managed, in addition to severe agricultural productivity limitations, impacts may include:

- Erosion hazards including tunnel erosion.
- Impeded soil infiltration and permeability.
- Slumping failure of batters.
- Soil dispersion leading to soil structure breakdown, increased run-off and increased turbidity run-off.

### **4.2.3 Soil Map Unit 2B**

#### **4.2.3.1 Description**

The SMU 2B dominant soil type was Eutrophic Red Dermosols.

#### **4.2.3.2 Location**

SMU 2B is located in the southern portion of the Project.

#### **4.2.3.3 Land-Use**

At the time of the field assessment, the land use within SMU 2B was cattle grazing.

#### **4.2.3.4 Management Considerations**

The topsoil with SMU 2B is suitable for stripping and reuse using standard ESC. The subsoil generally exhibits very strong alkalinity, sodicity and moderate salinity. If the subsoil is exposed and not managed, in addition to severe agricultural productivity limitations, impacts may include:

- Erosion hazards including tunnel erosion.
- Impeded soil infiltration and permeability.
- Slumping failure of batters.
- Soil dispersion leading to soil structure breakdown, increased run-off and increased turbidity run-off.

### **4.2.4 Soil Map Unit 3**

#### **4.2.4.1 Description**

The SMU 3 dominant soil type was Eutrophic Black-Brown Dermosols and subdominant soil types included Chromosols.

#### **4.2.4.2 Location**

SMU 3 is located in the western and central portion.

#### **4.2.4.3 Land-Use**

At the time of the field assessment, the land use within SMU 3 was cattle grazing.

#### 4.2.4.4 Management Considerations

The topsoil within SMU 3 is suitable for stripping and reuse using standard ESC. The subsoil generally exhibits very strong alkalinity, sodicity and moderate salinity.

If the subsoil is exposed and not managed, in addition to severe agricultural productivity limitations, impacts may include:

- Erosion hazards including tunnel erosion.
- Impeded soil infiltration and permeability.
- Slumping failure of batters.
- Soil dispersion leading to soil structure breakdown, increased run-off and increased turbidity run-off.

### 4.3 Soil Resources and Erosion Potential

#### 4.3.1 Soil Resource Summary

Based on the soil survey results, topsoil resources available in the Project are summarised in **Table 4-3**. It is noted that these soil resources are presented for informative purposes.

**Table 4-3 Available Soil Resource Summary**

Topsoil Map Unit	ASC Soil Type	Hectares	Topsoil Depth (m)	Topsoil Volume (m <sup>3</sup> )
1	Self-Mulching Black-Brown Vertosol	8,275	0.1	8,275,000
2A	Eutrophic Red Dermosol	167	0.1	167,000
2B	Eutrophic Red Dermosol	168	0.2	336,000
3	Eutrophic Black-Brown Dermosol	400	0.1	400,000
<b>Topsoil Volume Available</b>				<b>9,178,000</b>

#### 4.3.2 Erosion Potential

An Emerson Aggregate Test (EAT) semi-quantitatively classifies the coherence of soil aggregates in water to provide an indication of dispersive properties and susceptibility to erosion. The ratings are based on a hierarchical class system where a rating of 1 being the most dispersive and 8 being non-dispersive. Approximately 30% of the analysed sites have topsoil with negligible potential for dispersion, having an EAT rating of 4. The remaining 70% analysed topsoil sites have EAT ratings of 2 and 3, which indicates a moderately high to high potential for dispersion. Approximately 95% of subsoil samples have EAT ratings of 2 and 3, indicating a moderately high to high potential for dispersion. Only 5% or one (1) analysed site has subsoil with a negligible dispersion potential of EAT 4. Full EAT results are presented in **Appendix D**.

## 5.0 Soil and Land Resource Impact Assessment

The soil and land resource impact assessment takes into consideration land suitability, agricultural land, grazing suitability and land capability assessments.

As per current practice at BWM, mining for the Project will continue to the east and the mined-out void areas to the west will be progressively back-filled and rehabilitated. Final voids will remain at the conclusion of mining in some of the pits. In addition to the void, the relief and slope of the rehabilitated area (created by backfilling the pits) will increase compared to pre-mining. This rehabilitated area is located west of the final void area and east of the western boundary of the Project. The final conceptual landform is depicted in **Figure 5-1**.

The conceptual post-mining land use depicted in **Figure 5-2** includes indicative areas for:

- Cattle grazing.
- Woodland habitat.
- Non-Use Management Area (NUMA).
- Land outside the indicative project footprint (which may include areas of cattle grazing, woodland habitat, water storage or watercourses).

### 5.1 Land Suitability Methodology

The information required for the land suitability assessment was collected during the desktop assessment and verified on the ground during the field survey and laboratory testing program. The land suitability classification was applied across the Project in accordance with the Regional Land Suitability Frameworks for Queensland (DSITI & DNRM, 2013), in particular Section 10 Suitability Framework for the Inland Fitzroy and Southern Burdekin Area and the Guidelines for Agricultural Land Evaluation in Queensland, 2<sup>nd</sup> Edition (DSITI & DNRM, 2015). This framework uses the biophysical features of the land and soil to derive detailed ratings tables for a range of land and soil hazards. The scheme consists of eight (8) limitations that classify the land based on severity against the suitability subclasses for various land management options. The eight (8) limitations associated with the biophysical features that are assessed by the framework are:

- Water erosion (E).
- Erosion hazard, subsoil erodibility (Es).
- Soil water availability (M).
- Narrow moisture range (Pm).
- Surface condition (Ps).
- Rockiness (R).
- Microrelief (Tm).
- Wetness (W).

The suitability framework provides the detail for assessing which cropping and cattle grazing activities are suitable for individual mapped areas of land or soil. Each hazard was assessed against set criteria tables, as described in the framework, with each hazard ranked from 1 (most suitable) through to 5 (least suitable) with the overall ranking of the land determined by its most significant limitation, as described in **Table 5-1**.

**FIGURE 5-2**

**Table 5-1 Land Suitability Class**

Class	Description
1	Suitable land with negligible limitations and is highly productive requiring only simple management practices.
2	Suitable land with minor limitations which either reduce production or require more than simple management practices to sustain the use.
3	Suitable land with moderate limitations. Land which is moderately suited to a proposed use but which requires significant inputs to ensure sustainable use.
4	Marginal land with severe limitations which make it doubtful whether the inputs required to achieve and maintain production outweigh the benefits in the long term.
5	Unsuitable land with extreme limitations that precludes its use.

## 5.2 Land Suitability Results

### 5.2.1 Pre-Mining

The land suitability assessment has rated SMU 1, which covers the majority of the Project, as Class 4 for cropping and Class 3 for grazing, with the main limitations being soil wetness (W) and soil water availability (M). SMUs 2A, 2B and 3 are rated as Class 5 for cropping and Class 4 for grazing, with the same limitations as SMU 1. Results for the pre-mining Land Suitability Assessment are shown in **Figure 5-3** and the detailed land suitability assessment is presented in **Appendix E**.

### 5.2.2 Post-Mining

Land suitability (cropping and grazing) classes for areas not scheduled for the proposed mining activity disturbances are likely to remain the same. This includes some Class 4 and 5 cropping and Class 3 and 4 grazing areas located in the eastern portion of the Project. Areas scheduled for the proposed mining activity disturbances will be managed and rehabilitated to meet the Rehabilitation Requirements included in Table E1 as per their assigned Post Mining Land Use (PMLU). The PMLU within the disturbance areas will have the following implications to the pre-mining land suitability classes:

- The PMLU areas to be rehabilitated to cattle grazing will likely retain the pre-mining land suitability classes.
- The PMLU areas to be rehabilitated to woodland habitat will present additional limitations (e.g. steeper slopes and increased rockiness) to the land, which will reduce the land suitability class to marginal land with severe limitations (Class 4) or unsuitable land (Class 5).

**FIGURE 5-3**

### 5.3 Agricultural Land Class Assessment

Agricultural Land Classification in Queensland follows a simple hierarchical scheme that is applicable across the state. It allows the presentation of interpreted land evaluation data to indicate the location and extent of agricultural land that can be used sustainably for a wide range of land uses with minimal land degradation. Provision is also made to highlight areas that may be suitable for one specific crop considered important in a particular area. Three broad classes of agricultural land (Class A to Class C) and one non-agricultural land class (Class D) are identified in the Agricultural Land Class system (DSITI & DNRM, 2015) presented in **Table 5-2**:

**Table 5-2 Agricultural Land Classes**

Class	Description
A	Crop land – Land that is suitable for current and potential crops with limitations to production which range from none to moderate levels.
A1	Suitable for a wide range of current and potential broadacre and horticultural crops.
A2	Suitable for a wide range of current and potential horticultural crops only.
B	Limited crop land – Land that is marginal for current and potential crops due to severe limitations; and suitable for pastures. Engineering and/or agronomic improvements may be required before the land is considered suitable for cropping.
C	Pasture land – Land that is suitable only for improved or native pastures due to limitations which preclude continuous cultivation for crop production; but some areas may tolerate a short period of ground disturbance for pasture establishment.
C1	Suitable for grazing sown pastures requiring ground disturbance for establishment; or native pastures on higher fertility soils.
C2	Suitable for grazing native pastures, with or without the introduction of pasture, and with lower fertility soils than C1.
C3	Suitable for light grazing of native pastures in accessible areas, and includes steep land more suited to forestry or catchment protection
D	Non-agricultural land – Land not suitable for agricultural uses due to extreme limitations. This may be undisturbed land with significant habitat, conservation and/or catchment values or land that may be unsuitable because of very steep slopes, shallow soils, rock outcrop or poor drainage.

## 5.4 Agricultural Land Class Results

### 5.4.1 Pre-Mining

The agricultural Land Assessment indicates the Project, consisting of SMU 1, 2A, 2B & 3, is rated as Class C1, pastureland, suitable for grazing improved and native pastures. Results for the pre-mining agricultural land assessment are presented in **Figure 5-4**.

### 5.4.2 Post-Mining

Agricultural land classes for areas not scheduled for the proposed mining activity disturbances are likely to remain the same. This includes some Class C1 located in the eastern portion of the Project. Areas scheduled for the proposed mining activity disturbances will be managed and rehabilitated to meet the Rehabilitation Requirements included in Table E1 as per their assigned PMLU. The PMLU within the disturbance areas will have the following implications to the pre-mining land suitability classes:

- The PMLU areas to be rehabilitated to cattle grazing will likely retain the pre-mining agricultural land classes.
- The PMLU areas to be rehabilitated to woodland habitat will present additional limitations (e.g., steeper slopes and increased rockiness) to that land, which will result in a Class C3 or Class D agricultural land class classification.

FIGURE 5-4

## 5.5 Land Capability Assessment

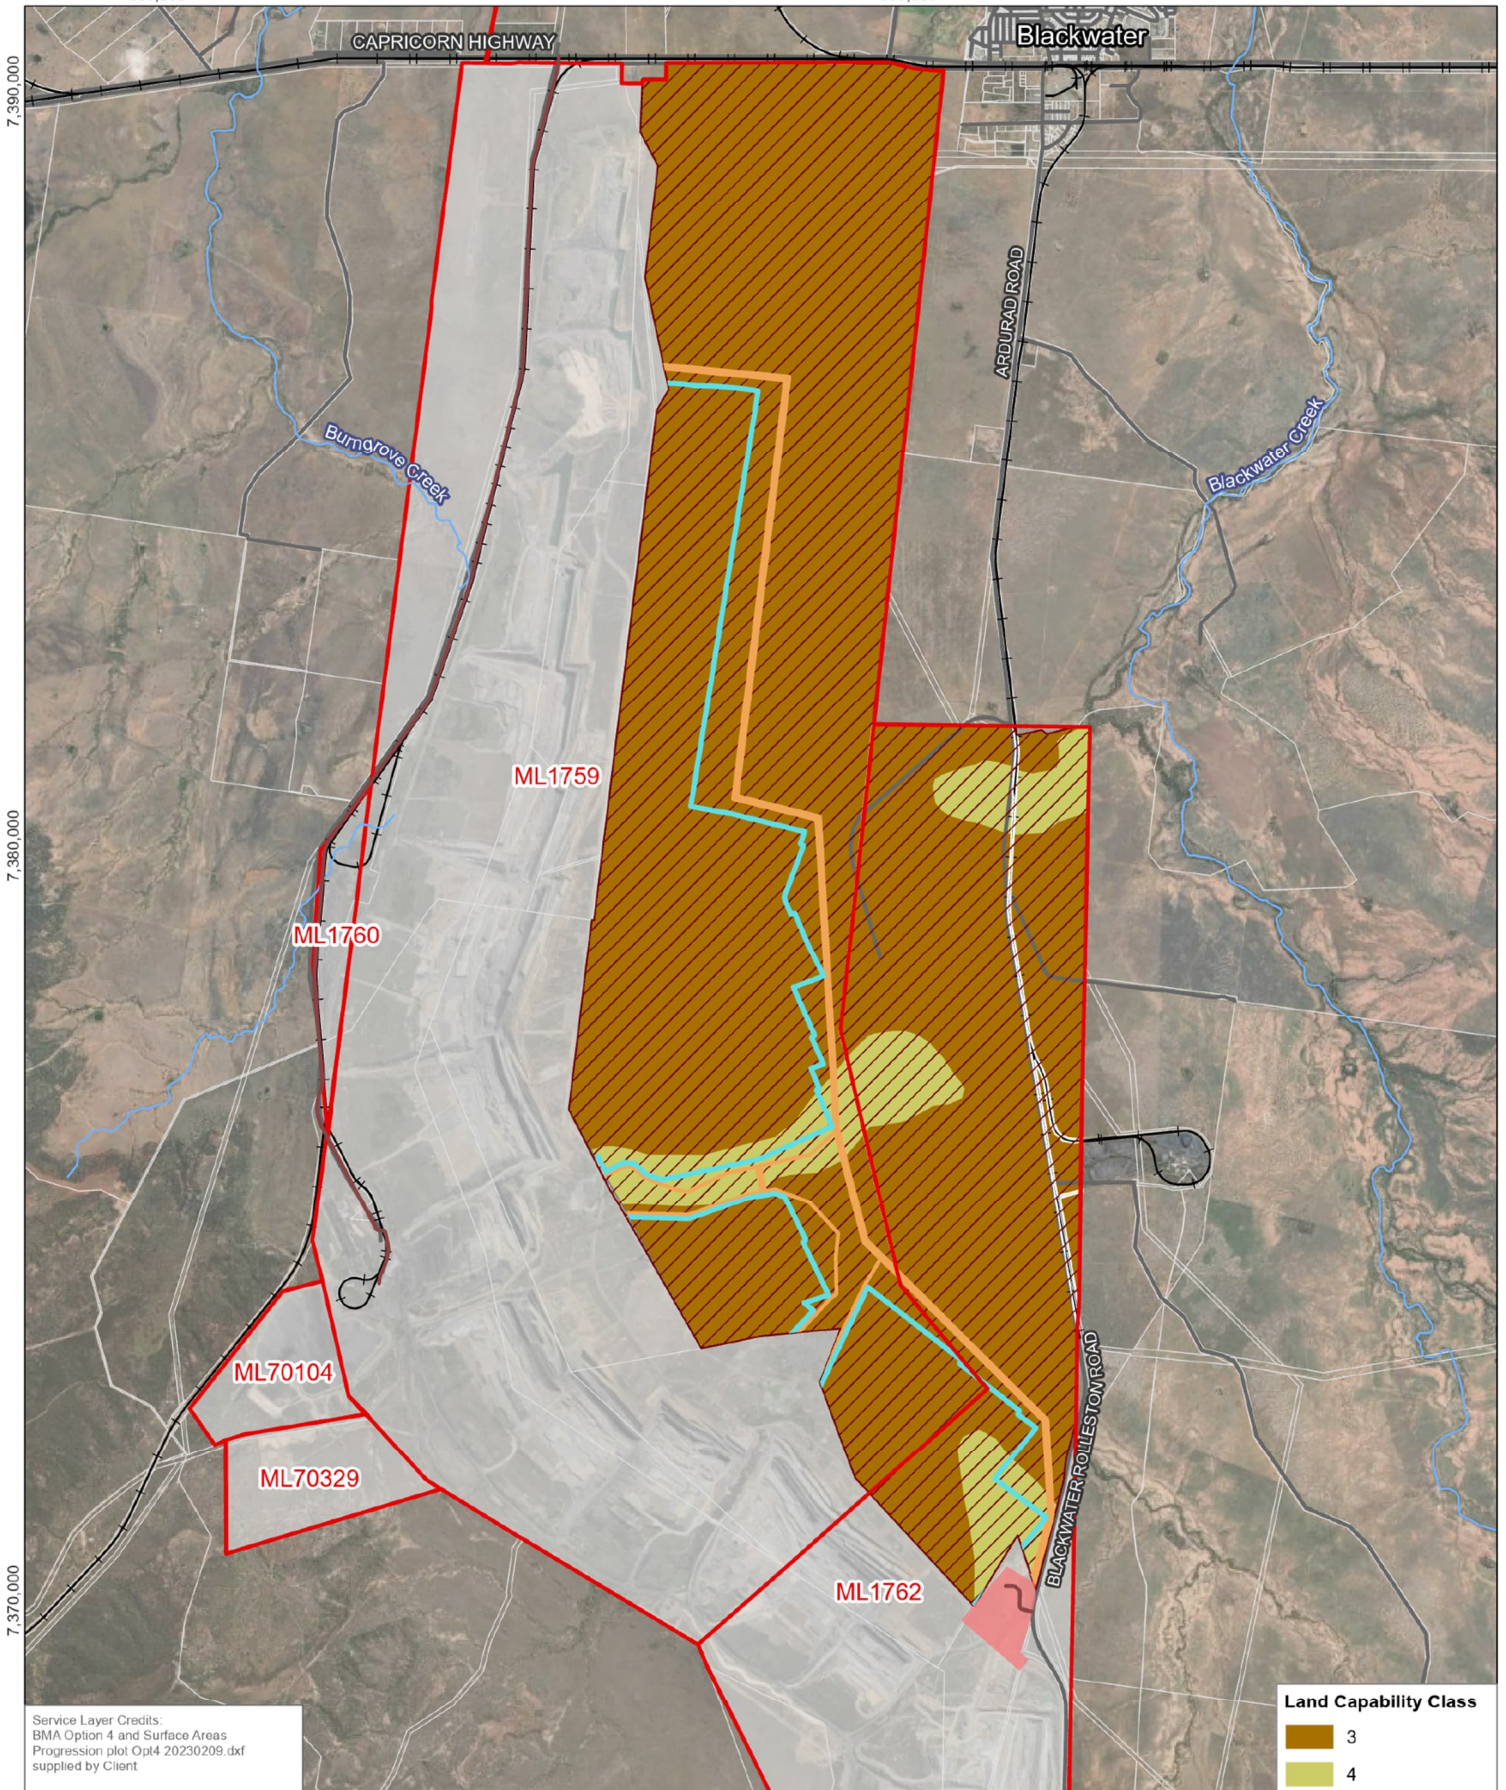

Land capability classification evaluates the potential of land for broadly defined land uses, e.g., cropping, pastoral, non-agricultural. In Queensland, it is generally only used for broad scale assessment of land.

The system uses eight classes, described in **Table 5-3**, with limitations and hazards to agricultural and pastoral use becoming progressively greater from Class I to Class VIII, accompanied by a decreasing adaptability and choice of use. Lower-numbered classes (Classes I to III) are suited to more intense uses while higher-numbered classes are suited only to low-intensity agricultural use or conservation. Class VIII is unsuited to either cultivation or grazing.

**Table 5-3 Land Capability Classes**

Class	Description
I	Land suitable for all agricultural and pastoral uses
II	Land suitable for all agricultural uses but with slight restrictions for cultivation
III	Land suitable for all agricultural uses but with moderate restrictions for cultivation
IV	Land primarily suited to pastoral use but which may be safely used for occasional cultivation with careful management
V	Land that in all other characteristics would be arable but has limitations that make cultivation impractical and/or uneconomic
VI	Land that is not suitable for cultivation but is well suited to pastoral use
VII	Land that is not suitable for cultivation but on which pastoral use is possible only with careful management
VIII	Land that has such severe limitations that it is unsuited for either cultivation or grazing

**FIGURE 5-5**

## 5.6 Land Capability Results

### 5.6.1 Pre-Mining

The Land capability assessment indicates SMU 1 is rated as Class III land suitable for all agricultural uses but with moderate restrictions for cultivation. The main limitations of the Class III area are wetness, soil salinity/sodicity and landscape complexity. The balance of the Project is rated as Class IV, which is land primarily suited to pastoral use but may be safely used for occasional cultivation with careful management. The main limitations of the Class IV area are soil water availability, soil salinity/sodicity and landscape complexity. Results for the pre-mining land capability assessment are presented in **Figure 5-4** and the detailed Land capability assessment is provided in **Appendix E**.

### 5.6.2 Post-Mining

Land capability classes for areas not scheduled for the proposed mining activity disturbances are likely to remain the same. This includes some Class III and Class IV areas located in the eastern portion of the Project. Areas scheduled for the proposed mining activity disturbances will be managed and rehabilitated to meet the Rehabilitation Requirements included in Table E1 as per their assigned PMLU. The PMLU within the disturbance areas will have the following implications to the pre-mining land suitability classes:

- The PMLU areas to be rehabilitated to cattle grazing will likely retain the pre-mining land capability classes.
- The PMLU areas to be rehabilitated to woodland habitat will present additional limitations (e.g., steeper slopes and increased rockiness) to that land, which will result in a Class VII or Class VIII land capability classification.

## 5.7 Grazing Suitability Assessment

As part of the rehabilitation requirements of the EA, a grazing suitability assessment is required. The information required for applying the Queensland land suitability classification for cattle grazing specifically to the assessment of open-cut coal mine rehabilitation in Queensland's Bowen Basin was collected during the desktop assessment and verified on the ground during the field survey and laboratory testing program. The land suitability classification was applied across the Project in accordance with a rule-set for land suitability assessment of sustainable beef cattle grazing on land rehabilitated after open-cut mining in the Bowen Basin, Queensland draft (Short, 2013), of which the Guidelines for Agricultural Land Evaluation in Queensland, 2<sup>nd</sup> Edition (DSITI & DNRM, 2015) forms the basis. This framework and the typical soil and land features of grazing systems in the Bowen Basin derive detailed ratings tables for a range of land and soil hazards. The scheme consists of 11 limitations for cattle grazing in coal mine rehabilitation and have been selected based upon:

- The target post-mining land use of sustainable cattle grazing.
- The regional scale of application across the Bowen Basin.
- Diagnostic attributes that can be readily correlated to mapping units at potential mapping scales of 1:50,000 and larger.

The 11 limitations and land-use associated with the biophysical features assessed by the framework are:

- Water availability (M) – adequate water storage in the soil profile to maintain plant growth.
- Nutrient supply – adequate nutrient supply (Nd) and soil pH is suitable for plant growth and does not cause nutrient toxicities or deficiencies (Nr).
- Soil physical factors, surface condition (Ps) – ease of seed germination and establishment.
- Salinity (Sa) – low level of soluble salts in the soil profile.
- Rockiness (R) – minimal impact from gravel, stone and rock at the soil surface.
- Topography\* – accessible slope gradients (Ts) and accessible surface micro-relief (Tm).
- Water erosion (E) – minimal soil loss and land degradation.
- Subsoil erosion (ES) – minimal soil loss and land degradation.
- Potentially acid forming materials (D) – minimal environmental and agronomic impacts from low pH drainage.

\*Note: These limitations are to do with restrictions to safe and efficient access by vehicles and stock (cattle and horses).

The suitability framework provides the detail for assessing which cattle grazing activities are suitable and for what grazing system for individual mapped areas of land or soil. Each hazard was assessed against set criteria tables, as described in the framework, with each hazard ranked from 1 (most suitable) through to 5 (unsuitable) with the overall ranking of the land determined by its most significant limitation, as described in **Table 5-4**.

**Table 5-4 Land Suitability Class for Cattle Grazing on Rehabilitation**

Class	Suitability	Grazing System	Description
1	Suitable	Fattening/finishing	Rehabilitation capable of attaining maximum grazing productivity, i.e., production of young, finished, grass fed, export quality cattle in most seasons.
2	Suitable	Growing	Rehabilitation on which younger cattle perform well but may be difficult to finish at a young age, depending on seasonal conditions.
3	Suitable	Breeding	Rehabilitation able to carry breeding stock all year round depending on seasons.
4	Unsuitable	Sometimes	Rehabilitation that is unsuitable most of the time but may be grazed in better seasons for short periods in conjunction with other country.
5	Unsuitable	Never	Rehabilitation that is not suitable for cattle grazing.

## 5.8 Grazing Suitability Results

### 5.8.1 Pre-Mining

The grazing suitability assessment indicates SMU 1 is rated as Class 4, with the main limitations being soil water availability (m), nutrient supply (Nr), soil physical factors and subsoil erosion (Es). SMU2A is rated as Class 3 with the main limitations of soil water availability and salinity. The balance of the Project made up of SMU2B and SMU3 are rated as Class 4, with the main limitations of soil water availability (m) and soil physical factors (p). Results for the pre-mining Grazing Suitability Assessment are shown in **Figure 5-6** and the detailed grazing suitability assessment is presented in **Appendix E**.

### 5.8.2 Post-Mining

Grazing suitability classes for areas not scheduled for the proposed mining activity disturbances are likely to remain the same. This includes the Class 3 and some Class 4 areas located in the eastern portion of the Project.

Areas scheduled for the proposed mining activity disturbances will be managed and rehabilitated to meet the Rehabilitation Requirements included in Table E1 as per their assigned PMLU. The PMLU within the disturbance areas will have the following implications to the pre-mining grazing suitability classes:

- The PMLU areas to be rehabilitated to cattle grazing will likely retain the pre-mining grazing suitability.

## 6.0 Rehabilitation

### 6.1 Rehabilitation Goals

The BWM PRCP is yet to be developed. BWM has a transitional notice for the PRCP and once developed, submitted, and approved, the PRCP will guide the long-term rehabilitation and closure strategy for BWM. The BWM PRCP is due to be submitted in November 2024.

In accordance with the conditions of the BWM Environmental Authority (EPML00717813), all areas significantly disturbed by mining activities will be rehabilitated in accordance with Table E1 of the EA. Table E1 outlines objectives, indicators and acceptance criteria for rehabilitation relating to goals for creating land that is:

- Safe to humans and wildlife.
- Non-polluting.
- Stable.
- Able to sustain an agreed post-mining land use.

The stability of the post-mine landform will be achieved by applying sound rehabilitation practices. Landforms will be established following mining, using soils capable of supporting vegetation communities adapted to the local environment. The rehabilitation practices are designed to stabilise the landform, protect downstream water quality, and aid a sustainable outcome for the Project area.

### 6.2 Rehabilitation Methodology

Rehabilitation of the Project will be in accordance with the BWM rehabilitation commitments as per the upcoming PRCP and the BWM EA.

#### 6.2.1 Soil and Material Balances

Soils for rehabilitation are salvaged and made available for reuse in establishing a soil profile on the post-mining landform. Volume calculations and soil balance will be determined to inform post-mining requirements for soil depths. The estimated volume of suitable soil throughout the Project is summarised in **Section 4.3.1** and includes 9,178,000 m<sup>3</sup> of topsoil (as shown in **Table 4-3**). The soil survey and laboratory results were used to determine depth of soil material suitable for recovery and reuse as material in rehabilitation. Factors requiring management considerations include sodicity, salinity and alkalinity.

#### 6.2.2 Soil Sourcing and Substitution

Suitable topsoil will be stripped for use in later rehabilitation. The topsoil will either be stockpiled until suitable re-contoured areas are available, or directly returned across areas to be rehabilitated. The results of the land resources assessment identified that the topsoil resources are adequate for the rehabilitation of the disturbed areas.

Where practicable, soil will be stripped in a slightly moist condition and not be stripped in either an excessively dry or wet condition to prevent pulverisation of the natural soil aggregates or damage of the resource through compaction by equipment.

To reduce soil degradation during stripping operations preference will be given to using equipment which can grade or push soil into windrows such as graders or dozers for later collection by conventional truck and shovel techniques. This will minimise compaction impacts of heavy equipment that is often necessary for economical transport of soil material. These techniques are examples of preferential, less aggressive soil handling systems which may be adopted.

### **6.2.3 Soil Placement and Management**

All soils removed will be placed in designated stockpile areas or returned to areas available for immediate rehabilitation. Freshly stripped and placed topsoil retains seed, micro-organisms and nutrients than stockpiled soil and vegetation establishment is generally improved by the direct return of topsoil and is considered 'best practice' topsoil management. Where long term storage stockpiles be proposed, accurate records are required indicating stockpile volumes and locations. Soil stockpiles within work areas could be used as long-term batters or bunds to facilitate noise amelioration, visual screening and surface water diversion where required.

The following management and mitigation strategies and/or the BWM Topsoil Management Procedure (where applicable) is to be implemented to reduce degradation during stockpiling operations.

- Locations of stockpiles will be recorded using GPS along with data relating to the soil type and volume. An inventory of available soil is maintained and updated regularly to ensure adequate topsoil will be available for planned rehabilitation activities.
- The surface of soil stockpiles will be left in as coarsely structured condition where practicable to promote rainfall infiltration and minimise erosion prior to cover vegetation becoming established.
- Soil types with significantly different properties should be stockpiled separately.
- Storage time will be minimised, where possible. If long term stockpiling is planned, stockpiles should be seeded with an annual cover crop.
- Growth media including topsoil will be spread to depths according to target requirements.
- Where possible, suitable growth media will be re-spread directly onto rehabilitation areas. Growth media will be treated with fertiliser and seeded in one consecutive operation, reducing the potential for compaction and topsoil loss to wind and water erosion.

Stockpiles are not disturbed until required for rehabilitation, weed management, erosion control or for seeding and fertilising purposes. Ameliorants are applied post-spreading of soil resources on rehabilitation areas.

### **6.2.4 Vegetation Establishment**

#### **6.2.4.1 Timing**

Revegetation operations will consider both the season and timing of potential germination during the drier months. The preferred seeding timing for woodland habitat is expected to be in September/early October or April/May when there is sufficient soil moisture in the profile.

### 6.2.4.2 Revegetation

Revegetation methods for all types of disturbed land within the Project will normally consist of the following:

- Respreading of freshly stripped or stockpiled topsoil .
- Contour ripping.
- Application of appropriate fertiliser and ameliorants for plant establishment, after soil chemical analysis, if required.
- Seeding with the appropriate seed mix.

Contour ripping is used as an erosion control measure immediately after surface preparation and before revegetation. A seed mix containing pasture grass and/or local native shrub and tree species is used to establish a sustainable vegetation cover suitable for the post mining land use.

### 6.2.5 Erosion and Sediment Control

The principal objectives of erosion and sediment control for rehabilitation areas are to:

- Minimise erosion and sedimentation from all active and rehabilitated areas, thereby minimising sediment ingress into surrounding surface waters.
- Segregate contact water (surface run-off from disturbed catchments e.g., active areas of disturbance, stockpiles and rehabilitated areas until stabilised) from clean water (surface run-off from catchments that are undisturbed or relatively undisturbed by Project-related activities and rehabilitated catchments) and maximise the retention time of contact water so that any discharge from the disturbance area is in line with the EA.
- Avoid the potential for runoff and incorporate suitable erosion and sediment control measures in accordance with the BWM ESC Plan.
- Manage surface flows upstream of any surface disturbance during Project works so that rehabilitation activities are not affected by excessive run-on water.
- Establish sustainable long-term surface water management features following rehabilitation of the site, including implementation of an effective revegetation and maintenance program.
- Monitor the effectiveness of erosion and sediment controls and maintain, in accordance with the requirements of the BWM ESC Plan.
- Land disturbance will be restricted to that necessary for the Project.
- Disturbance will be controlled using the BWM Permit to Disturb process and in accordance with the EA.
- All available topsoil will be salvaged for use in rehabilitation, where practicable.
- Erosion from topsoil stockpiles will be managed in accordance with the BWM ESC Plan which requires stockpile sites to be located outside the limits of drainage lines, with controls to prevent mobilising stockpiled material and capture sediment.
- Topsoil stockpiles will be managed in accordance with the BWM Topsoil Management Procedure.
- Stormwater and runoff from catchments directly upstream of the Project will be diverted away from the site during Project works.
- Vehicles to utilise maintained tracks and roads.

**Table 6-1** summarises the risks associated with surface disturbance and the associated erosion and sediment control measures which can be applied.

**Table 6-1 Erosion Causes and Control – Soil Disturbance Activities**

Area	Control Measure
Cleared Land	Restrict clearing to areas essential for the Project works. Windrow vegetation debris along the contour. Minimise length of time soil is exposed. Divert run-off from undisturbed areas away from the Project works. Direct run-off from cleared areas to be dealt with as outlined in the BWM ESC Plan.
Rehabilitation	Install drainage control works as outlined in the BWM ESC Plan. Spread topsoil or appropriate growth media, rip on the contour and seed with appropriate seed mix.
Infrastructure	Vehicles to utilise maintained tracks and roads. Sediment will be controlled as outlined in the BWM ESC Plan. Rehabilitate disturbed areas around work sites as soon as practicable after becoming available.

## 7.0 Land Resources Mitigation Measures

Potential impacts to land resources and rehabilitation have been considered, and include the following:

- Impacts to land due to disturbance from mining activities (and changes to land use.
- Soil loss due to wind or water erosion.
- Reduction in soil quality and fertility including nutrient loss.
- Inability to achieve post-mine land uses.
- Contamination of land due to leaks or spills from plant, storage facilities or infrastructure and/or transport of contaminated soil or water and introduction into previously uncontaminated areas.

The following general mitigation strategies are to be implemented by the Project to minimise the extent and severity of land disturbance and constraints on rehabilitation, thus mitigating risks that could result in environmental impacts:

- Clearing will occur within the area approved via the BWM's Permit to Disturb process.
- Appropriate storage and management of hydrocarbons and hazardous materials within the MIA to prevent contamination of land e.g., bunding.
- Disturbance to be undertaken in consideration of water flows that could affect land resources during early mining activities.
- Topsoil will be stripped prior to mining and direct re-spread is the preferred method to minimise topsoil handling and reduce damage to soil structure and propagules.
- Topsoil that is not directly re-spread will be stockpiled for re-use in rehabilitation.
- Appropriate surface water management measures are to be implemented including clean water diversions, and use of in-pit sumps and sediment dams to capture mine affected runoff and stormwater as outlined in the Water Management Plan.
- Monitoring and maintenance of rehabilitation until post-mining land use criteria and relinquishment have been achieved.

## 8.0 Conclusion

The objective of the Soil and Land Resource Assessment was to identify the soil types, qualities and resources available for rehabilitation and conduct an impact assessment. This was to determine the impacts on existing soils and recommend practical and reasonable mitigation measures.

In line with this approach, four (4) Soil Map Units (SMU) were identified in the assessment, comprising the following:

- SMU 1A Self-Mulching Brown-Black Vertosol.
- SMU 2A Eutrophic Red Dermosol.
- SMU 2B Eutrophic Red Dermosol.
- SMU 3 Eutrophic Red-Brown Dermosol.

The land suitability assessment indicates:

- SMU 1A are rated as Class 4 (marginal land with severe limitations) for cropping and Class 3 (suitable land with moderate limitations) for grazing, with the main limitations being soil wetness (w) and soil water availability (m).
- SMU 2A, 2B and 3 is rated as Class 5 (unsuitable land) for cropping and Class 4 (marginal land with severe limitations) for grazing, with the main limitations being soil wetness (w) and soil water availability (m).
- The PMLU areas to be rehabilitated to cattle grazing will likely retain the pre-mining land suitability classes.
- The PMLU area to be rehabilitated to woodland habitat will present additional limitations to the land, which will reduce the land suitability class to marginal land with severe limitations (Class 4) or unsuitable land (Class 5).

The agricultural land assessment indicates:

- SMU 1, 2A, 2B and 3 are rated as Agricultural Land Class C1, pasture land suitable for grazing both native and improved pasture species.
- The PMLU areas to be rehabilitated to cattle grazing will likely retain the pre-mining agricultural land classes.
- The PMLU areas to be rehabilitated to woodland habitat will present additional limitations to that land, which will result in a Class C3 or Class D agricultural land class classification.

The land capability assessment indicates:

- SMU 1 is rated as Class III land that is suitable for all agricultural uses but with moderate restrictions for cultivation.
- SMU 2A, 2B and 3 are rated as Class IV, land primarily suited to pastoral use but which may be safely used for occasional cultivation with careful management.
- The PMLU areas to be rehabilitated to cattle grazing will likely retain the pre-mining land capability classes.
- The PMLU area to be rehabilitated to woodland habitat will present additional limitations to that land, which will result in a Class VII or Class VIII land capability classification.

The grazing land suitability assessment indicates:

- SMU 1, 2B and 3 is rated as Class 4 and is noted as land that is unsuitable for high intensity grazing, however, may be utilised in above average seasonal rainfall conditions.
- SMU 2A is rated as Class 3 (167 ha) and is noted as land that is suitable to carry breeding stock all your round depending on seasons.
- The PMLU areas to be rehabilitated to cattle grazing will likely retain the pre-mining grazing suitability.
- The PMLU area to be rehabilitated to woodland habitat will present additional limitation to that land, which will result in unsuitable (Class 4 or 5) grazing suitability.

Parameter	K0498/11	K0498/12	K0498/13	K0498/14	K0498/15

- Notes:**
- All results presented as a 40°C oven dried weight. Soil sieved and lightly crushed to < 2 mm.
  - Methods from Rayment and Lyons, 2011. *Soil Chemical Methods - Australasia*. CSIRO Publishing: Collingwo
  - Soluble Salts included in Exchangeable Cations - NO PRE-WASH (unless requested).
  - 'Morgan 1 Extract' adapted from 'Science in Agriculture', 'Non-Toxic Farming' and LaMotte Soil Handbook.
  - Guidelines for phosphorus have been reduced for Australian soils.
  - Indicative guidelines are based on 'Albrecht' and 'Reams' concepts.
  - Total Acid Extractable Nutrients indicate a store of nutrients.
  - National Environmental Protection (Assessment of Site Contamination) Measure 2013, Schedule B(1) - Guideline on Investigation Levels for Soil and Groundwater. Table 5-A Background Ranges.
  - Information relating to testing colour codes is available on sheet 2 - 'Understanding your agricultural soil res
  - Conversions for 1 cmol<sub>e</sub>/kg = 230 mg/kg Sodium, 390 mg/kg Potassium, 122 mg/kg Magnesium, 200 mg/kg Calcium
  - Conversions to kg/ha = mg/kg x 2.24
  - The chloride calculation of Cl mg/L = EC x 640 is considered an estimate, and most likely an over-estimate
  - \*\* NATA accreditation does not cover the performance of this service.
  - Analysis conducted between sample arrival date and reporting date.
  - This report is not to be reproduced except in full. Results only relate to the item tested.
  - All services undertaken by EAL are covered by the EAL Laboratory Services Terms and Conditions (refer sc
  - This report issued 2/12/2020 replaces the original report issued on 30/11/2020.

Quality Checked: Kris Saville  
 Agricultural Co-Ordinator

Parameter	Method reference

**Notes:**

- All results presented as a 40°C oven dried weight. Soil sieved and lightly crushed to < 2 mm.
- Methods from Rayment and Lyons, 2011. *Soil Chemical Methods - Australasia*. CSIRO Publishing: Collingwo
- Soluble Salts included in Exchangeable Cations - NO PRE-WASH (unless requested).
- 'Morgan 1 Extract' adapted from 'Science in Agriculture', 'Non-Toxic Farming' and LaMotte Soil Handbook.
- Guidelines for phosphorus have been reduced for Australian soils.
- Indicative guidelines are based on 'Albrecht' and 'Reams' concepts.
- Total Acid Extractable Nutrients indicate a store of nutrients.
- National Environmental Protection (Assessment of Site Contamination) Measure 2013, Schedule B(1) - Guideline on Investigation Levels for Soil and Groundwater. Table 5-A Background Ranges.
- Information relating to testing colour codes is available on sheet 2 - 'Understanding your agricultural soil res
- Conversions for 1 cmol<sub>e</sub>/kg = 230 mg/kg Sodium, 390 mg/kg Potassium, 122 mg/kg Magnesium, 200 mg/kg Calcium
- Conversions to kg/ha = mg/kg x 2.24
- The chloride calculation of Cl mg/L = EC x 640 is considered an estimate, and most likely an over-estimate
- \*\* NATA accreditation does not cover the performance of this service.
- Analysis conducted between sample arrival date and reporting date.
- This report is not to be reproduced except in full. Results only relate to the item tested.
- All services undertaken by EAL are covered by the EAL Laboratory Services Terms and Conditions (refer sc
- This report issued 2/12/2020 replaces the original report issued on 30/11/2020.

Quality Checked: Kris Saville

**Note:**

- The Hydrometer Analysis method was used to determine the percentage sand, silt and clay, modified from SOP meth004 (California Dept of Pesticide Regulation), using method of Gee & Bauder (1986), in *Methods of Soil Analysis. Part 1* Agron. Monogr. 9 (2nd Ed). Klute, A., American Soc. of Agronomy Inc., Soil Sci. Soc. America Inc., Madison WI: 383-411.
- Australian Standard 1289.3.8.1-1997 (see attached)
- Analysis conducted between sample arrival date and reporting date.
- All services undertaken by EAL are covered by the EAL Laboratory Services Terms and Conditions (refer scu.edu.au/eal or on request).
- Results relate to the samples tested.
- This report was issued on 03/12/2020.

# Appendix B Detailed Profile Descriptions

## Land Resources Assessment Report

BM Alliance Coal Operations

SLR Project No.: 620.014601.00001

7 December 2023

## Soil Unit 1: Self-Mulching Black-Brown Vertosol

### Self-Mulching Black Vertosol

**Table 1 Summary: Self-Mulching Black Vertosol (Site B02)**

Overview	
Landscape Site B02	
	
<b>ASC Name</b>	Self Mulching Black Vertosol
<b>Representative Site</b>	B02
<b>Other Mapped Sites</b>	B03-B11, B13-B19, B21-B27, B29-B43
<b>Survey Type</b>	Detailed
<b>Dominant Topography</b>	Plain
<b>Dominant Land Use</b>	Pasture
<b>Microrelief</b>	Incipient Linear Gilgai
<b>Vegetation</b>	Brigalow, Carrisa
<b>Slope (%)</b>	1-3%
<b>Aspect</b>	Nil

**Table 2 Profile: Self-Mulching Black Vertosol (Site B02)**

Profile	Horizon / Depth (m)	Description
	<p>A1 0.0 – 0.30</p>	<p>Very dark greyish brown (10YR 3/2) light clay, strong structure of 90 mm subangular blocky peds with a rough fabric and very firm consistence. 20%, &lt;5mm metamorphic stone content; abundant fine roots; imperfectly drained; gradual and wavy boundary.</p> <p>Sampled 0.00 – 0.10m &amp; 0.20 – 0.30m.</p>
	<p>B21 0.30 – 0.60</p>	<p>Dark brown (10YR 3/3) light-medium clay, strong structure of 140mm subangular blocky peds with a rough fabric and firm consistence. 25% pale faint mottling; 10%, &lt;5mm metamorphic stone content; 5% ferromanganiferous concretions &lt;5mm and 5% calcareous soft segregations &lt;5mm, &lt;2% highly calcareous soft segregations; many fine roots; gradual and wavy boundary.</p> <p>Sampled 0.50 – 0.60m.</p>
	<p>B22 +0.60</p>	<p>Yellowish-red (5YR 4/6) light clay, strong structure of 160mm subangular blocky peds with a rough fabric and firm consistence. 25% pale distinct mottling; 10%, &lt;5mm metamorphic stone content; 10% ferromanganiferous concretions &lt;2mm and 30% very highly calcareous soft segregations 10mm; coarse roots common.</p> <p>Sampled 0.90 – 1.0m.</p>

## Soil Unit 1: Self-Mulching Black-Brown Vertosol

### Self-Mulching Black Vertosol

**Table 3 Summary: Self-Mulching Black Vertosol (Site B03)**

Overview	
Landscape Site B03	
	
ASC Name	Self-Mulching Black Vertosol
Representative Site	B03
Other Mapped Sites	B02-B11, B13-B19, B21-B27, B29-B43
Survey Type	Detailed
Dominant Topography	Plain
Dominant Land Use	Pasture
Microrelief	Incipient Gilgai
Vegetation	Brigalow, Bauhinia
Slope (%)	<1%
Aspect	Nil

**Table 4 Profile: Self-Mulching Black Vertosol (Site B03)**

Profile	Horizon / Depth (m)	Description
	<p>A1 0.00 – 0.10</p>	<p>Dusky red (2.5YR 3/2) light-medium clay, strong structure of 70 mm subangular blocky peds with a rough fabric and firm consistence. 10%, 10mm metamorphic stone content; abundant fine roots; imperfectly drained; gradual and wavy boundary.</p> <p>Sampled 0.00 – 0.10m.</p>

Aspect	Nil	
Profile		Description
		A1 (0.00 – 0.20m):Dark brown (7.5YR 3/2) light medium clay, moderate structure, subangular blocky peds.

## Self-Mulching Brown Vertosol

**Table 5 Profile: Self-Mulching Brown Vertosol (Check Site 5)**

Overview	
ASC Name	Self-Mulching Brown Vertosol
Representative Site	C05
Soil Map Unit	1
Survey Type	Check Site
Dominant Topography	Plain
Dominant Land Use	Pasture
Vegetation	Brigalow
Slope (%)	0-2
Slope Type	Minimal
Aspect	Nil
	
	
Profile	Description
	<p>A1 (0.00 – 0.10m): Brown (7.5YR 5/2) light medium clay, moderate structure, subangular blocky pedes.</p>

## Self-Mulching Brown Vertosol

**Table 6 Profile: Self-Mulching Brown Vertosol (Check Site 6)**

Overview		
ASC Name	Self-Mulching Brown Vertosol	 
Representative Site	C06	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		<p>A1 (0.00 – 0.10m): Dark yellowish brown (10YR 4/4) silty clay, moderate structure, subangular blocky peds.</p>

## Self-Mulching Black Vertosol

**Table 7 Profile: Self-Mulching Black Vertosol (Check Site 7)**

Overview		
ASC Name	Self-Mulching Black Vertosol	 
Representative Site	C07	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		A1 (0.00 – 0.10m): Very dark grey (7.5YR 3/1) medium clay, strong structure subangular blocky peds.

## Self-Mulching Brown Vertosol

**Table 8 Profile: Self-Mulching Brown Vertosol (Check Site 8)**

Overview		
ASC Name	Self-Mulching Brown Vertosol	 
Representative Site	C08	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		A1 (0.00 – 0.10m): Strong brown (7.5YR 5/6) silty clay, moderate structure subangular blocky pedes.

## Self-Mulching Brown Vertosol

**Table 9 Profile: Self-Mulching Brown Vertosol (Check Site 9)**

Overview		
ASC Name	Self-Mulching Brown Vertosol	 
Representative Site	C09	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		A1 (0.00 – 0.10m) Brown (7.5YR 5/3) light-medium clay, strong structure, subangular blocky peds.

## Self-Mulching Brown Vertosol

**Table 10 Profile: Self-Mulching Brown Vertosol (Check Site 10)**

Overview		
ASC Name	Self-Mulching Brown Vertosol	 
Representative Site	C10	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow	
Slope (%)	2-3	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		A1 (0.00 – 0.10m): Yellowish brown (10YR 5/6) medium clay, moderate structure subangular blocky peds.

## Self-Mulching Brown Vertosol

**Table 11 Profile: Self-Mulching Brown Vertosol (Check Site 11)**

Overview		
ASC Name	Self-Mulching Brown Vertosol	 
Representative Site	C11	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		A1 (0.00 – 0.10m): Yellowish brown (101YR 5/8) light-medium clay, moderate structure, subangular blocky peds.

Representative Site	C16	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		<p>A1 (0.00 – 0.10m): Brown (7.5YR 5/3) light clay, moderate structure, subangular blocky peds.</p>

## Brown Dermosol

**Table 17 Profile: Brown Dermosol (Check Site 17)**

Overview		
ASC Name	Brown Dermosol	
Representative Site	C17	
Soil Map Unit	1 (Sub-Dominant Soil Type)	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow, Bottle Tree	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		<p>A1 (0.00 – 0.10m): Light brown (7.5YR 6/4) sandy loam, weak crumb structure.</p> <p>B2 (+0.10m) Strong brown (7.5YR 5/8) clay loam, moderate structure, blocky peds.</p>

## Self-Mulching Brown Vertosol

**Table 18 Profile: Self-Mulching Brown Vertosol (Check Site 18)**

Overview		
ASC Name	Self-Mulching Brown Vertosol	 
Representative Site	C18	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow, Bottle Tree	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		A1 (0.00 – 0.10m): Dark brown (10YR 3/3) light clay, moderate structure, subangular blocky peds.

## Self-Mulching Brown Vertosol

**Table 19 Profile: Self-Mulching Brown Vertosol (Check Site 19)**

Overview		
ASC Name	Self-Mulching Brown Vertosol	 
Representative Site	C19	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow, Bottle Tree	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		<p>A1 (0.0 – 0.10m): Brown (7.5YR 5/4) light-medium clay, moderate structure, subangular blocky peds.</p>

## Brown Dermosol

**Table 20 Profile: Brown Dermosol (Check Site 20)**

Overview	
ASC Name	Brown Dermosol
Representative Site	C20
Soil Map Unit	1 (Sub-Dominant Soil Type)
Survey Type	Check Site
Dominant Topography	Drainage Line
Dominant Land Use	Pasture
Vegetation	Bauhinia, Brigalow
Slope (%)	0-2
Slope Type	Minimal
Aspect	Nil
	
	
Profile	Description
	<p>A1 (0.00 – 0.20m): Brown (10YR 5/4) sandy loam, weak crumb structure.</p> <p>B21 (+0.20m): Brown (10YR 4/4) sandy clay loam, weak structure, blocky peds.</p>

## Self-Mulching Brown Vertosol

**Table 21 Profile: Self-Mulching Brown Vertosol (Check Site 21)**

Overview	
ASC Name	Self-Mulching Brown Vertosol
Representative Site	C21
Soil Map Unit	1
Survey Type	Check Site
Dominant Topography	Plain
Dominant Land Use	Pasture
Vegetation	Brigalow
Slope (%)	0-2
Slope Type	Minimal
Aspect	Nil
	
	
Profile	Description
	<p>A1 (0.00 – 0.10m): Dark brown (7.5YR 3/4) light clay, strong structure, subangular blocky peds.</p>

## Brown Dermosol

**Table 22 Profile: Brown Dermosol (Check Site 22)**

Overview		
ASC Name	Brown Dermosol	 
Representative Site	C22	
Soil Map Unit	3	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		A1 (0.00 – 0.10m): Light brown (7.5YR 6/4) clay loam, moderate structure, blocky peds.

## Self-Mulching Brown Vertosol

**Table 23 Profile: Self-Mulching Brown Vertosol (Check Site 23)**

Overview		
ASC Name	Self-Mulching Brown Vertosol	 
Representative Site	C23	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow, Carissa	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		A1 (0.00 – 0.10m): Brown (7.5YR 4/3) medium clay, strong structure, subangular blocky peds.

## Self-Mulching Brown Vertosol

**Table 24 Profile: Self-Mulching Brown Vertosol (Check Site 24)**

Overview		
ASC Name	Self-Mulching Brown Vertosol	 
Representative Site	C24	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow, Carissa	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		A1 (0.0 – 0.10): Brown (7.5YR 5/3) light clay, moderate structure; blocky peds.

## Brown Dermosol

**Table 25 Profile: Brown Dermosol (Check Site 25)**

Overview		
ASC Name	Brown Dermosol	 
Representative Site	C25	
Soil Map Unit	1 (Sub-dominant Soil Type)	
Survey Type	Check Site	
Dominant Topography	Drainage Line	
Dominant Land Use	Pasture	
Vegetation	Brigalow, Carissa	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		<p>A1 (0.00 – 0.20m): Light brown (7.5YR 6/4) sandy loam, weak crumb structure; gradual boundary.</p> <p>B2 (+0.20m): Brown (10YR 5/3) sandy clay loam, weak structure, blocky peds.</p>

## Self-Mulching Brown Vertosol

**Table 26 Profile: Self-Mulching Brown Vertosol (Check Site 26)**

Overview		
ASC Name	Self-Mulching Brown Vertosol	 
Representative Site	C26	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow, Carissa	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		A1 (0.00 – 0.10m): Brown (10YR 5/3) light-medium clay, moderate structure, blocky peds.

## Self-Mulching Brown Vertosol

**Table 27 Profile: Self-Mulching Brown Vertosol (Check Site 27)**

Overview

Overview		
ASC Name	Self-Mulching Brown Vertosol	 
Representative Site	C28	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Bauhinia, Carissa	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		<p>A1 (0.00 – 0.10m): Yellowish brown (10YR 5/6) silty clay, moderate structure, blocky peds.</p>

## Self-Mulching Brown Vertosol

**Table 29** Profile: Self-Mulching Brown Vertosol (Check Site 29)

Overview	
ASC Name	Self-Mulching Brown Vertosol
Representative Site	C29
Soil Map Unit	1
Survey Type	Check Site
Dominant Topography	Plain
Dominant Land Use	Pasture
Vegetation	Brigalow
Slope (%)	0-2
Slope Type	Minimal
Aspect	Nil
	
	
Profile	Description
	<p>A1 (0.00 – 0.10m): Brown (7.5YR 5/3) light clay, moderate structure, subangular blocky peds.</p>

## Red Dermosol

**Table 30 Profile: Red Dermosol (Check Site 30)**

Overview	
ASC Name	Red Dermosol
Representative Site	C30
Soil Map Unit	2B
Survey Type	Check Site
Dominant Topography	Plain
Dominant Land Use	Pasture
Vegetation	Brigalow
Slope (%)	0-2
Slope Type	Minimal
Aspect	Nil
Profile	Description
	A1 (0.00 – 0.10m): Yellowish red (5YR 4/6) sandy clay loam, weak blocky structure.

## Self-Mulching Brown Vertosol

**Table 31 Profile: Self-Mulching Brown Vertosol (Check Site 31)**

Overview		
ASC Name	Self-Mulching Brown Vertosol	
Representative Site	C31	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow, Carissa	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		A1 (0.00 – 0.10m): Light brown (7.5YR 6/3) light-medium strong structure, subangular blocky pedis.

## Self-Mulching Brown Vertosol

**Table 32 Profile: Self-Mulching Brown Vertosol (Check Site 32)**

Overview		
ASC Name	Self-Mulching Brown Vertosol	 
Representative Site	C32	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow, Carissa	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		<p>A1 (0.00 – 0.10m): Light brown (7.5YR 6/4) medium clay, strong structure, subangular blocky peds.</p>

## Epipedal Brown Vertosol

**Table 33 Profile: Epipedal Brown Vertosol (Check Site 33)**

Overview		
ASC Name	Epipedal Brown Vertosol	
Representative Site	C33	
Soil Map Unit	1 (Sub-Dominant Soil Type)	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		A1 (0.00 – 0.10m): Strong brown (7.5YR 4/6) light clay, moderate structure; blocky peds.

## Self-Mulching Brown Vertosol

**Table 34 Profile: Self-Mulching Brown Vertosol (Check Site 34)**

Overview		
ASC Name	Self-Mulching Brown Vertosol	 
Representative Site	C34	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Wilga, Brigalow	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		<p>A1 (0.00 – 0.20m): Brown (7.5YR 4/3) medium clay, strong structure, subangular blocky peds.</p>

## Brown Dermosol

**Table 35 Profile: Brown Dermosol (Check Site 35)**

Overview		
ASC Name	Brown Dermosol	
Representative Site	C35	
Soil Map Unit	3	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow, Carissa, Wilga	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		<p>A1 (0.00 – 0.10m): Strong brown (7.5YR 5/8) clay loam, moderate structure, blocky peds.</p>

## Self-Mulching Brown Vertosol

**Table 36 Profile: Self-Mulching Brown Vertosol (Check Site 36)**

Overview		
ASC Name	Self-Mulching Brown Vertosol	 
Representative Site	C36	
Soil Map Unit	1	
Survey Type	Check Site	
Dominant Topography	Plain	
Dominant Land Use	Pasture	
Vegetation	Brigalow	
Slope (%)	0-2	
Slope Type	Minimal	
Aspect	Nil	
Profile		Description
		A1 (0.00 – 0.10m): Brown (7.5YR 5/3) medium clay, strong structure, subangular blocky peds.

## Self-Mulching Brown Vertosol
